The selection of biotech stocks for investment is more difficult compared with the selection of other stocks and industries that possess historical data, since biotechnology is a recently new science. In the first edition of this book, we described the crucial parameters for the valuation of an early stage biotech company without a drug in the market. In this edition, we analyze novel financial models that can value stocks of biotech companies with products in the market or products under development (in pre-clinical and clinical studies). All of these parameters should be helpful to potential new investors when creating a stock portfolio that includes highly promising biotech companies. Our strategy of selecting highly promising stocks based on all parameters described in this book and of performing a basic financial modeling analysis with DFC and/or real options valuation models has proven very successful, as this strategy provides returns higher than 100% in most cases. In the first edition of this book, based on our strategy, we suggested that Juno Therapeutics and Kite Pharma were "hot" stocks. At that time, Kite's stock was \$50.19, while Juno's stock was \$54.21. Since then, Kite's stock reached \$179.79, with the company acquired by Gilead for \$11.9 billion, while Juno's stock reached \$86.96, with the company acquired by Celgene for \$9 billion. Furthermore, Moderna Therapeutics, a private company that we valued at \$5.5 billion in 2016 based on our real options financial model, today has a \$7.5 billion valuation. This newly revised and expanded version was written to help investors in the selection of biotech stocks based on different scientific and financial criteria.

The first book to provide a simple and practical means of valuing biotech companies The book begins with a short history of the biotechnology industry; this is important as although it is about 30 years old, the first company went public only in 1996, so it is possible to plot the course of investment waves and dips It examines the European industry and its evolvement, and draws parallels between the similarities and differences between that and the US Looks at the various companies which make up the biotech industry (therapeutic; life sciences; and the medical technology company) and gives tools for the investor to properly evaluate them Praise for Biotechnology Valuation "Keegan states that the valuation of Biotech companies is as much an art as a science. This brief but comprehensive review of the skills and knowledge required, not of just the financial market and sentiment, but also of the technical attributes of a company and the drug development and regulatory hurdles that must be overcome, highlights the importance of the breadth of understanding required. Biotech investing is not for the timid, but it can bring substantial returns. Keegan's book, punctuated with his personal experience and opinions, is a good place to start." —Chris Blackwell, Chief Executive, Vectura Group plc "A user-friendly, yet thorough discussion of a notoriously difficult topic. Dr Keegan's book is a fine resource for both business types and academicians." —Steve Winokur, Managing Director, CanaccordAdams "A highly readable and comprehensive explanation of the technical and commercial parameters that influence biotechnology companies at all stages of development, providing clear context for selection from the toolkit of valuation methodologies the author recommends to assess company and product performance, or ascribe value." —Dr L.M. Allan, Director, Bioscience Enterprise Programme, University of Cambridge "A fabulous approach to a difficult topic." —Deirdre Y. Gillespie, MD, President & CEO, La Jolla Pharmaceutical

Biotechnology Venture Capital Valuations is an authoritative, insider's perspective on biotech venture capital for both the venture capitalist and the entrepreneur. Featuring partners, presidents, and CEOs of top venture capital and investment firms, Biotechnology Venture Capital Valuations provides best practices for venture capitalists and entrepreneurs at all stages of investment with a focus on determining valuations and structuring deals. These industry experts discuss their strategies for considering a biotech investment, locating investment opportunity, assessing risk, and negotiating with the entrepreneur, as well as offering different valuation methods for a variety of common scenarios. This book provides valuable insight for those investing capital as well as those needing it, including explanation of the different goals of the venture capitalist and entrepreneur, common mistakes made on both sides, and how best to establish a productive relationship between the two.

If you're a biotech executive, investor, deal maker, entrepreneur, or adviser-or aspire to be one-then you need to know how to build and analyze forecasts and valuation models of R&D-stage drugs. The Pharmagellan Guide is a comprehensive, thoroughly referenced handbook for early-stage biopharma assets and companies.

Preserving the Promise: Improving the Culture of Biotech Investment critically examines why most biotech startups fail, as they emerge from universities into an ecosystem that inhibits rather than encourages innovation. This "Valley of Death" squanders our public investments in

medical research and with them, the promise of longer and healthier lives. The authors explicate the Translation Gap faced by early stage biotech companies, the result of problematic technology transfer and investment practices, and provide specific prescriptions for improving translation of important discoveries into safe and effective therapies. In *Preserving the Promise*, Dessain and Fishman build on their collective experience as company founders, healthcare investor (Fishman) and physician/scientist (Dessain). The book offers a forward-looking, critical analysis of "conventional wisdom" that encumbers commercialization practices. It exposes the self-defeating habits of drug development in the Valley of Death, that waste money and extinguish innovative technologies through distorted financial incentives. Explains why translation of biotech discovery into medicine succeeds so infrequently that it's been dubbed the Valley of Death Uncovers specific decision-making strategies that more effectively align incentives, improving clinical and financial outcomes for investors, inventor/entrepreneurs, and patients Examines the critical, early stages of commercialization, where technology transfer offices and Angels act as gatekeepers to development, and where tension between short-term financial and long-term clinical aspirations sinks important technologies Deconstructs the forces driving biotech, recasts them in a proven conceptual framework, and offers practical guidance for making the system better

This book is the first complete guide to valuation in life sciences for industry professionals, investors, and academics. It introduces the characteristics of drug and medical device development, explains how to translate these into the valuation, and provides valuable industry data. Special emphasis is put on the practicability of the proposed methods by including many

hands-on examples, without compromising on realistic results.

This invaluable book tells the reader how to invest in the healthcare biotechnology and life sciences sector, one of the fast-growing sectors of the US economy. Aimed at biotech investors as well as bioentrepreneurs and venture capitalists, it has been written from the perspectives of risk management and asset management/allocation. It strives to teach readers how to fish, rather than giving them fish. The author has over ten years of Wall Street experience in biotech research, investment banking and asset management. He holds an MBA in Finance and a PhD in Biochemistry.

Valuation is a hot topic among life sciences professionals. There is no clear understanding on how to use the different valuation approaches and how to determine input parameters. Some do not value at all, arguing that it is not possible to get realistic and objective numbers out of it. Some claim it to be an art. In the following chapters we will provide the user with a concise valuation manual, providing transparency and practical insight for all dealing with valuation in life sciences: project and portfolio managers, licensing executives, business developers, technology transfer managers, entrepreneurs, investors, and analysts. The purpose of the book is to explain how to apply discounted cash flow and real options valuation to life sciences projects, i.e. to license contracts, patents, and firms. We explain the fundamentals and the pitfalls with case studies so that the reader is capable of performing the valuations on his own and repeat the theory in the exercises and case studies. The book is structured in five parts: In the first part, the introduction, we discuss the role of the players in the life sciences industry and

their particular interests. We describe why valuation is important to them, where they need it, and the current problems to it. The second part deals with the input parameters required for valuation in life sciences, i.e. success rates, costs, peak sales, and timelines.
