Now in its fourth edition, this core textbook continues to provide a comprehensive, systematic guide to the examination and assessment of patients with neuromusculoskeletal dysfunction. The new edition continues with Nicola Petty at the helm but she is now joined by a reputable team of specialized clinicians and academics who have contributed to individual chapters. Neuromusculoskeletal Examination and Assessment focuses on the development of technical and clinical reasoning skills involved in differential diagnosis of joint, nerve and muscle tissues. It is designed for physiotherapy/manual therapy students and their teachers but is also ideal for those in the first years of their practice as an educational support for patient care. Provides a logical approach to patient examination to enhance clinical reasoning Presents key concepts of leading therapists and researchers in the field of manual therapy Emphasizes a patient-centred approach Templated step-by-step sequence of illustrations and text creates an accessible tool for use in teaching and practice New 2-colour drawings and photographs visually demonstrate techniques

Rev. ed. of: Principles of neuromusculoskeletal treatment and management / Nicola J. Petty. 2004.

A logical, systematic working guide to the examination and assessment of the neuromusculoskeletal system, combining a wide range of approaches used clinically around the world. It brings together as one process the examination and assessment of the structures involved: joints, nerve and muscle tissue. Each section follows the same logical, step by step sequence of illustrations and text. The book is designed for manual therapists requiring to identify and assess clinical problems in this area, whether student or clinician. Combines a wide range of commonly used approaches to examination and assessment Logical, repetitive structure from chapter to chapter Combines a wide range of commonly used approaches to examination and assessment Highly illustrated with specially commissioned photos and line drawings Written by an experienced lecturer in higher education who teaches the subject at both undergraduate and postgraduate level Well referenced Comprehensive but concise Logical, repetitive structure from chapter to chapter Written at a level suitable for undergraduate students in all the relevant specialties - easy to follow but does not "talk down" Chapters and references updated throughout. Updated photographs to make the text clearer for the reader. 224 new photographs. Second colour added to line drawings. Additional tables to improve clarity

Now in its fifth edition, this core textbook continues to provide a comprehensive, systematic guide to the examination, assessment and clinical reasoning processes needed by clinicians when managing patients with musculoskeletal conditions. Nicola Petty is joined by Dionne Ryder in editing this new edition, which also sees an expanded number of specialist clinicians and academics contributing individual chapters. Musculoskeletal Examination and Assessment provides an invaluable guide to the technical and clinical reasoning skills involved in the differential diagnosis of joint, nerve and muscle tissues within a psychosocial model of health and illness. Three initial chapters outline the subjective and physical examination as well as the clinical reasoning process. Subsequent chapters provide details of the examination for each region of the body. This edition is designed for physiotherapy and musculoskeletal therapy students as they get to grips with contemporary clinical practice. Provides a logical, clinically reasoned and evidence-enhanced approach to patient examination and assessment Emphasizes a patient-centred approach Presents key clinical concepts of leading therapists and researchers in the field of musculoskeletal therapy Many drawings and photographs visually demonstrate techniques while enhancing descriptions in the text Clinical examples bring to life the clinical reasoning process An emphasis on consideration of the patient's perspective Reliability, validity, sensitivity and specificity of the physical tests are highlighted Vascular considerations are included throughout the text References updated throughout

This is a practical guide to the examination and assessment of the neuromusculoskeletal system which aims to enable the therapist to identify a client's problem before deciding on a treatment. Because it focuses on these preliminary diagnostic processes it is a complementary text supporting books on the various treatment techniques themselves (such as the available books by Leon Chaitow, Gregory Grieve, etc). It brings together as one process the examination and assessment of all the structures involved: joint, nerve and muscle tissue, and is designed for use by anyone requiring to identify and assess clinical problems in this area - both student and clinician. It is highly illustrated with clear, step-by-step sequences of illustrations and text that are logical and easy to follow. The co-author Ann Moore is also co-author of The Clinical Educator - Role Development, and co-editor of the journal Manual Therapy. She is probably the best known person in the manual therapy field in the UK and beyond. Features: \* Addresses a need common to all manual therapists \* Complements 'technique manuals' by focusing on the preliminary diagnostic processes \* Helps therapists ensure that the chose

Rev. ed. of: Neuromusculoskeletal examination and assessment / Nicola J. Petty, Ann P. Moore. 1998.

The legacy of Geoff Maitland and his seminal work, Vertebral Manipulation, continues in this eighth edition, with Elly Hengeveld and Kevin Banks leading an international team of experts who demonstrate how to manage vertebral neuromusculoskeletal disorders using the principles and practice of the Maitland Concept. Together, they ensure the heart of the Concept beats on by promoting collaborative decision-making with the patient at centre and emphasizing the art and science of observation, listening, palpation and movement skills. A key feature of the new edition focuses on a more evidence-based and analytical view of the role of mobilization and manipulation in clinical practice The authors have written in a way that reflects their application of the Maitland Concept and how they have integrated techniques in the light of advancement in professional knowledge. Each chapter stands alone as a 'master class'. The text is systematically arranged focusing on detailed assessment, clinical reasoning and re-assessment to determine the physical dysfunction and efficacy of manipulative physiotherapy techniques, while also advocating continuous communication and interaction. Techniques of passive mobilization are also described, specifically designed around the individual patient's condition. All the chapters are written from a clinical perspective and review the evidence which informs how to deal with and manage spinal and pelvic pain as they present to the practitioner. Furthermore, each vertebral region (cervical, thoracic, lumbar, sacroiliac/pelvic) is considered from the point of view of best practice in analysing and hypothesising subjective data, examination, treatment and management of spinal pain conditions. Brand new to the eighth edition is the addition of a companion website - Maitland's Manipulation eResources (www.maitlandsresources.com) - providing access to a range of valuable learning materials which include videos, MCQs, interactive case studies, research links, and bonus chapters World-leading experts provide evidence relating the Maitland Concept to clinical practice Evidence supporting practice Covers both subjective and physical examination Best practice management using mobilization and manipulation Case studies - how and when to integrate the Maitland Concept into clinical practice Chapter-based learning outcomes, keywords and glossaries Companion website - Maitland's Manipulation eResources (www.maitlandsresources.com) Expert perspectives and supporting evidence Case studies Companion website - www.maitlandsresources.com - containing: Video Bank of over 480 video clips showing examination and treatment techniques Image Bank of over 1,000 illustrations Interactive case studies Over 200 MCQs Bonus chapters on additional principles and techniques of examination / treatment Weblink references to abstracts

This logical, systematic working guide to the examination of the neuromusculoskeletal system brings together the examination and assessment of the structures involved: joints, nerve and muscle tissue. Each section follows the same logical, step-by-step sequence of illustrations and text. Each joint examination starts with a list of the possible causes of pain and limitation of movement that should be considered during the examination process. The book is designed for use by anyone requiring to identify and assess clinical problems in this area, whether student or practitioner.

This title is directed primarily towards health care professionals outside of the United States. The authors combine the latest evidence-based knowledge from the fields of orthodontics, plastic and neurosurgery, as well as otolaryngeal treatments, physiotherapy and manual therapy to provide new treatment strategies for clinicians interested in craniofacial problems. This approach is based on the latest clinical reasoning models. Grounded in pain science theory and modern craniofacial growth concepts, the techniques can be integrated into any manual, neuro-orthopaedic orientated treatment model. This approach can be easily used in the daily clinic and adapted to a variety of patterns of craniofacial pain. Practical, evidence-based and comprehensive Highly illustrated Clearly described manual techniques and management strategies Clinically relevant Includes contributions from leaders in the field Covers adult and paediatric treatment

This reference is ideal for students who need support during their neuromusculoskeletal clinical practice in areas such as communication, clinical reasoning, examination and assessment. It is a vital source for understanding the role of mobilization and manipulation in helping to maximize the recovery, rehabilitation and functioning of patients with movement-related disorders. The principles of the Maitland Concept of Manipulative Physiotherapy are applied to each body region so as to guide the student through to the appropriate selection, application and progression of mobilization and manipulation techniques within the context of contemporary physiotherapeutic rehabilitation. A vital companion to the classic texts - Maitland's Vertebral Manipulation and Maitland's Peripheral Manipulation - which promotes a patient-centred approach to neuromusculoskeletal disorders. Learning objectives and self-assessment questions in every chapter enables students to reflect on their knowledge Case studies highlights key aspects of the concepts to clinical practice Clinical profiles for common neuromusculoskeletal conditions Techniques described and accompanied by over 500 images Picture key to identify types of examination, decision-making and techniques within the text
