A radical new approach to tackling the growing threat of water scarcity Water is essential to life, yet humankind's relationship with water is complex. For millennia, we have perceived it as abundant and easily accessible. But water shortages are fast becoming a persistent reality for all nations, rich and poor. With demand outstripping supply, a global water crisis is imminent. In this trenchant critique of current water policies and practices, Edward Barbier argues that our water crisis is as much a failure of water management as it is a result of scarcity. Outdated governance structures and institutions, combined with continual underpricing, have perpetuated the overuse and undervaluation of water and disincentivized much-needed technological innovation. As a result (water grabbing) is on the rise, and cooperation to resolve these disputes is increasingly fraught. Barbier draws on evidence from countries across the globe to show the scale of the problem, and outlines the policy and management solutions needed to avert this crisis.

As world population grows, and more people move to cities and suburbs, they place greater stress on the operating system of our whole planet. But urbanization and increasing densities also present our best opportunity for improving sustainability, by transforming urban development into desirable, lower-carbon, compact and walkable communities and business centers. Jonathan Barnett and Larry Beasley seek to demonstrate that a sustainable built and natural environment can be achieved through ecodesign, which integrates the practice of planning and urban design with environmental conservation, through normal business practices and the kinds of capital programs and regulations already in use in most communities. Ecodesign helps adapt the design of our built environment to both a changing climate and a rapidly growing world, creating more desirable places in the process. In six comprehensively illustrated chapters, the authors explain ecodesign concepts, including the importance of preserving and restoring natural systems while also adapting to climate change; minimizing congestion on highways and at airports by making development more compact, and by making it easier to walk, cycle and take trains and mass transit; crafting and managing regulations to insure better placemaking and fulfill consumer preferences, while incentivizing preferred practices; creating an inviting and environmentally responsible public realm from parks to streets to forgotten spaces; and finally how to implement these ecodesign concepts. Throughout the book, the ecodesign framework is demonstrated by innovative practices that are already underway or have been accomplished in many cities and suburbs:from Hammarby Sjöstad in Stockholm to False Creek North in Vancouver to Battery Park City in Manhattan, as well as many smaller-scale examples that can be adopted in any community. Ecodesign thinking is relevant to anyone who has a part in shaping or influencing the future of cities and suburbs ÷ designers, public officials, and politicians.

Transportation plays a substantial role in the modern world; it provides tremendous benefits to society, but it also imposes significant economic, social and environmental costs. Sustainable transport planning requires integrating environmental, social, and economic factors in order to develop optimal solutions to our many pressing issues, especially carbon emissions and climate change. This essential multi-authored work reflects a new sustainable transportation planning paradigm. It explores the concepts of sustainable development and sustainable transportation, describes practical techniques for comprehensive evaluation, provides tools for multi-modal transport planning, and presents innovative mobility management solutions to transportation problems. This text reflects a fundamental change in transportation decision making. It focuses on accessibility rather than mobility, emphasizes the need to expand the range of options and impacts considered in analysis, and provides practical tools to allow planners, policy makers and the general public to determine the best solution to the transportation problems facing a community. Featuring extensive international examples and case-studies, textboxes, graphics, recommended reading and end of chapter questions, the authors draw on considerable teaching and researching experience to present an essential, ground-breaking and authoritative text on sustainable transport. Students of various disciplines, planners, policymakers and concerned citizens will find many of its provocative ideas and approaches of considerable value as they engage in the processes of understanding and changing transportation towards greater sustainability.

Climate change may be all around us, but it is often difficult to see. Carbon dioxide is invisible, and the prevailing imagery of climate change is often remote (such as ice floes melting) or abstract and scientific (charts and global temperature maps). Nobody really knows what 2 or 4 of global warming might look like in their community. The causes of climate change that surround us are often only dimly perceived or concealed, and there are as yet few examples of effective community solutions that people can see.

"Having been born a freeman, and for more than thirty years enjoyed the blessings of liberty in a free State;and having at the end of that time been kidnapped and sold into Slavery, where I remained, until happily rescued in the month of January, 1853, after a bondage of twelve years;it has been suggested that an account of my life and fortunes would not be uninteresting to the public." -an excerpt

The Truth and Reconciliation Commission urged a better understanding of Aboriginal law for all Canadians. This book responds to that call, outlining significant legal developments in straightforward, non-technical language. Jim Reynolds provides the historical context needed to understand the relationship between Indigenous peoples and settlers and explains key topics such as sovereignty, fiduciary duties, the honour of the Crown, Aboriginal rights and title, treaties, the duty to consult, Indigenous laws, and international law. He concludes that rather than leaving the judiciary to sort out essentially political issues, politicians need to take responsibility for this crucial aspect of building a just society.
