ECOLOGICAL FOREST MANAGEMENT Buy Ecological Forest Management Handbook Paperback / softback by ISBN: 9780367870317

The nature of forest genetic resources. Impacts of management in production forests. The future of tropical forests. Strategies for in situ conservation in production forests. Case studies: Ghana. Brazil: the Amazon forests. India: the Western Ghat forests, Karnataka

This major reference book comprises specially commissioned surveys in environmental and resource economics written by an international team of experts. Authoritative yet accessible, each entry provides a state-of-the-art summary of key areas that will be invaluable to researchers, practitioners and advanced students.

This comprehensive handbook provides a unique resource covering all aspects of forest ecology from a global perspective. It covers both natural and managed forests, from boreal, temperate, sub-tropical and tropical regions of the world. The book is divided into seven parts, addressing the following themes: forest types forest dynamics forest flora and fauna energy and nutrients forest conservation and management forests and climate change human impacts on forest ecology. While each chapter can stand alone as a suitable resource for a lecture or seminar, the complete book provides an essential reference text for a wide range of students of ecology, environmental science, forestry, geography and natural resource management. Contributors include leading authorities from all parts of the world.

In recent years, issues related to forests have come to prominence on the international agenda. This reflects growing concern over the fate of forest ecosystems and possible loss of the benefits which they provide. In the process of moving towards sustainable management of forests, there is growing demand for practical methodologies for full valuation of forests which permit the contributions of forests to be presented more clearly and in a manner which decision-makers can readily appreciate. Appropriate techniques should be able to adequately capture forest values in terms of the environmental, social and production functions and to recognise the worth of both marketed and non-marketed goods and services. This publication reviews approaches which can overcome the limitations of conventional analysis and provides a reference framework to help clarify what approaches to forest valuation can or cannot work. The publication is not itself a manual on valuation techniques but by reviewing the various approaches, makes it possible to select appropriate methodologies for which it then refers readers to other publications which can provide "how to do" details.

The purpose of this study is to bring together available information about the role of common property as a system of governance and its present relevance to forest management and use, to review the historical record of common property systems that have disappeared or survived, to examine the experience of selected contemporary collective management programmes in different countries, and to identify the main factors that appear to determine success or failure at the present time.

This comprehensive handbook provides a unique resource covering all aspects of forest ecology from a global perspective. It covers both natural and managed forests, from boreal, temperate, sub-tropical and tropical regions of the world. The book is divided into seven parts, addressing the following themes: forest types forest dynamics forest flora and fauna energy and nutrients forest conservation and management forests and climate change human impacts on forest ecology. While each chapter can stand alone as a suitable resource for a lecture or seminar, the complete book provides an essential reference text for a wide range of students of ecology, environmental science, forestry, geography and natural resource management.
