piles, they technically known as caissons. Of closed and open ended.

The theoretical approach consist a vast applications of variety of theorems combined with tables and graphical solutions. Part II, It is mostly dealing with determination of pullout capacity of foundations normally subjected to pullout forces, where the

Download Free Geotechnical

theoretical approach predicts the pullout capacity of the vertical anchors, this is usually applied to support high transmission of electricity, or to stable partially or fully submerged structures or pipe lines. Part III, focuses on applied technique to improve troublesome soils and very weak rocks,

technically named as
Grouting, it is an
engineering procedure to
remedies foundations or
dam embankments and
ground cavities, by
injecting soil base or
chemical materials for
purpose to strengthen or
seal the soil media. Part
IV, contains very value
technical information
and data usually needed
in the design of

foundations for super structures, particularly during the initial stages of design. Part V, this concerns with normally costly soil testing procedure called Triaxial Test. It requires the use of three undisturbed soil samples to perform the test, where this part discusses in depth how to use a single undisturbed soil sample to accomplish
