Repackaged with a new Afterword, this "valuable and entertaining" (New York Times Book Review) book explores how scientists are adapting nature's best ideas to solve tough 21st century problems Biomimicry is rapidly transforming life on earth. Biomimics study nature's most successful ideas over the past 3.5 million years, and adapt them for human use. The results are revolutionizing how materials are invented and how we compute, heal ourselves, repair the environment, and feed the world. Janine Benyus takes readers into the lab and in the field with maverick thinkers as they: discover miracle drugs by watching what chimps eat when they're sick; learn how to create by watching spiders weave fibers; harness energy by examining how a leaf converts sunlight into fuel in trillionths of a second; and many more examples. Composed of stories of vision and invention, personalities and pipe dreams, Biomimicry is must reading for anyone interested in the shape of our future.

The second edition of this established textbook provides an accomplished introduction to the principles of nutrition and metabolism with increasing emphasis on the integration and control of metabolism. This book explores the interactions between diet and health and explains the basis for current dietary goals and recommendations. Essential biochemistry for understanding functions of nutrients and the importance of diet and nutrition in health and disease is presented in a clear and authoritative manner. Dr Bender's text asks the question 'Why eat?', and explores the role of diet in the development of the 'diseases of the affluent' as well as obesity and under-nutrition. Clear and simple diagrams aid the discussion of metabolic pathways, and nutritional and physiological aspects are linked throughout. This is an essential text for anyone studying nutrition, dietetics, food science and medicine at an introductory level.
