A synthesis of nearly 2,000 articles to help make engineersbetter educators While a significant body of knowledge has evolved in the fieldof engineering education over the years, much of the publishedinformation has been restricted to scholarly journals and has notfound a broad audience. This publication rectifies that situationby reviewing the findings of nearly 2,000 scholarly articles tohelp engineers become better educators, devise more effectivecurricula, and be more effective leaders and advocates incurriculum and research development. The author's first objective is to provide an illustrativereview of research and development in engineering education since1960. His second objective is, with the examples given, toencourage the practice of classroom assessment and research, andhis third objective is to promote the idea of curriculumleadership. The publication is divided into four main parts: Part I demonstrates how the underpinnings ofeducation-history, philosophy, psychology, sociology-determine the aims and objectives of the curriculumand the curriculum's internal structure, which integratesassessment, content, teaching, and learning Part II focuses on the curriculum itself, considering such keyissues as content organization, trends, and change. A chapter oninterdisciplinary and integrated study and a chapter on project andproblem-based models of curriculum are included Part III examines problem solving, creativity, and design Part IV delves into teaching, assessment, and evaluation,beginning with a chapter on the lecture, cooperative learning, andteamwork The book ends with a brief, insightful forecast of the future ofengineering education. Because this is a practical tool andreference for engineers, each chapter is self-contained and may beread independently of the others. Unlike other works in engineering education, which are generallyintended for educational researchers, this publication is writtennot only for researchers in the field of engineering education, butalso for all engineers who teach. All readers acquire a host ofpractical skills and knowledge in the fields of learning,philosophy, sociology, and history as they specifically apply tothe process of engineering curriculum improvement andevaluation.

This book reports on advanced theories and methods in three related fields of research: applied physics, system science and computers. It is organized in two main parts, the first of which covers applied physics topics, including lasers and accelerators; condensed matter, soft matter and materials science; nanoscience and quantum engineering; atomic, molecular, optical and plasma physics; as well as nuclear and high-energy particle physics. It also addresses astrophysics, gravitation, earth and environmental science, as well as medical and biological physics. The second part focuses on advances in system science and computers, exploring automatic circuit control, power systems, computer communication, fluid mechanics, simulation and modeling, software engineering, data structures and applications of artificial intelligence among other areas. Offering a collection of contributions presented at the 1st International Conference on Applied Physics, System Science and Computers (APSAC 2016), the book bridges the gap between applied physics and electrical engineering. It not only presents new methods, but also promotes collaborations between different communities working on related topics at the interface between physics and engineering, with a special focus on communication, data modeling and visualization, quantum information, applied mechanics as well as bio and geophysics.
