 Solubility is applicable to many laboratory processes and is also important in medicine. Some ions can be toxic when they separate in a solution but are helpful as part of a compound. A saturated solution is one in which the maximum amount of solute has been dissolved. The opposite is a dilute solution; this solution can accept more solute.

The finished reaction is: 2 KCl(aq) + Pb(NO₃)₂ (aq) → 2 KNO₃ (aq) + PbCl₂ (s) The solubility rules are a useful guideline to predict whether a compound will dissolve or form a precipitate. There are many other factors that can affect solubility, but these rules are a good first step to determine the outcome of aqueous solution reactions.

Precipitation Reaction: Using Solubility Rules

Depending on the solubility of a solute, there are three possible results: 1) if the solution has less solute than the maximum amount that it is able to dissolve (its solubility), it is a dilute solution; 2) if the amount of solute is exactly the same amount as its solubility, it is saturated; 3) if there is more solute than is able to be dissolved, the excess solute separates from the solution. If this separation process includes crystallization, it forms a precipitate.

Predicting Precipitates Using Solubility Rules. Some combinations of aqueous reactants result in the formation of a solid precipitate as a product. However, some combinations will not produce such a product. If solutions of sodium nitrate and ammonium chloride are mixed, no reaction occurs. One could write a molecular equation showing a double-replacement reaction, but both products, sodium chloride and ammonium nitrate, are soluble and would remain in the solution as ions.

For best results, test peptide solubility with a small amount of product. Allow the peptide to warm to room temperature (preferably in a desiccator) before reconstituting. Always use sterile water or buffer (Tris or phosphate, buffer at pH 7) when preparing solutions. For peptides containing Cys, Met or Trp, which are susceptible to rapid oxidation, use oxygen-free solvents. Solubility also can be facilitated by

Peptide solubility guidelines (1) rev-Final

Importantly, attempt to dissolve the peptide in sterile water solution first. If water is not effective, proceed to the following guidelines: [] If the overall net charge of the peptide is positive, attempt to dissolve the peptide in an acetic acid solution (10%-30%). If this is unsuccessful, try TFA (< 50 []).
