New! Based around Server 5.5 & macOS High Sierra. Updated January 2018. This guide describes how to setup a network based around Apple's Server product. It is intended for someone who is responsible for setting up a network for use in a small business, home, home-based office or other organization such as a church, charity or small school. It addresses what some refer to as 'the Goldilocks problem', meaning that the built-in help system of Server is too basic and lacking in information, whereas the detailed and pricey reference guides that are available are just too complicated for many people. Hopefully, this is somewhere towards the middle ground. It assumes a reasonable working knowledge of the Mac and a general appreciation of what is involved in small computer networks, whilst trying to avoid the geeky stuff. Incidentally, the guide is not exclusively Mac and, in recognition of the fact that many people work in a mixed environment, includes plenty of information on how to connect and use Windows computers as well. This new version is suitable for both Server 5.5 and Server 5.4, with numerous improvements, new topics and troubleshooting notes.
