National Water Sector Strategy ... Strategic Roadmap. The Lebanese water sector is facing shortcomings both on the infrastructure ... Surface water resources are largely exploited but with limited storage, while significant stress is put on groundwater mainly through private wells 1

This paper focuses on how to improve the development and management of water resources while providing the principles that link resource management to the specific water-using sectors. In 1993 the Board of the World Bank endorsed a Water Resources Management Policy Paper. In that paper, and this Strategy, water resources management is seen to comprise the institutional framework; management instruments; and the development, maintenance and operation of infrastructure. The paper looks at the dynamics of water and development. It builds on the 1993 policy paper, evaluating current scenarios and looking at future options and their implications both for government policy and the World Bank.

First Published in 2009. Routledge is an imprint of Taylor & Francis, an informa company.

This title examines how regulatory frameworks have addressed the various basic issues related to water resources management, and provides a comparative analysis of those issues. It elicits and discusses what it considers are the essential elements for a regulatory framework for water resources management, and identifies some emerging trends.

This monograph comprehensively examines water law regulations and reform in the present decade, going beyond a simple analysis of existing water law and regulations to encompass environmental, social, economic, and human rights aspects of water as a natural resource. Using the specific case of India and on the related international law and policy framework that directly influences water regulatory developments in India, this book offers what will be the first and only analysis of water law reforms taking place at the national level in many developing countries in their domestic and international context. On the one hand, international freshwater law remains under-developed and existing legal instruments such as the 1997 UN Convention only address a limited set of relevant issues. Yet, the international law and policy framework concerning freshwater is increasingly important in shaping up law reforms taking place at the national level, in particular in developing countries. Indeed, non-binding resolutions such as the Dublin Statement on Water and Sustainable Development (1992) have had an immense influence on water law reforms in most developing countries. This book seeks to conceive of and analyse freshwater regulation in a broader context, and go beyond a literature that either lauds or criticises ongoing water sector reforms to provide an analytical basis for the reforms which all countries will have to adopt in the near or medium-term future.

Agricultural water management is a vital practice in ensuring reduction, and environmental protection. After decades of successfully expanding irrigation and improving productivity, farmers and managers face an emerging crisis in the form of poorly performing irrigation schemes, slow modernization, declining investment, constrained water availability, and environmental degradation. More and better investments in agricultural water are needed. In response, the World Bank, in conjunction with many partner agencies, has compiled a selection of good experiences that can guide practitioners in the design of quality investments in agricultural water. The messages of 'Shaping the Future of Water for Agriculture: A Sourcebook for Investment in Agricultural Water Management' center around the key challenges to agricultural water management, specifically: • Building policies and incentives • Designing institutional reforms • Investing in irrigation systems improvement and modernization • Investing in groundwater irrigation • Investing in drainage and water quality management • Investing in water management in rainfed agriculture • Investing in agricultural water management in multipurpose operations • Coping with extreme climatic conditions • Assessing the social, economic, and environmental impacts of agricultural water investments 'Shaping the Future of Water for Agriculture' is an important resource for those interested and engaged in development with a focus on agricultural water.

The need for an integrated management of water resources has derived from the emerging understanding that the water crisis cannot solely be regarded as a hydrological crisis. Instead, it is frequently defined as a crisis of governance, as institutional and management scarcity are hindering a sustainable, equitable and efficient use of water resources. Integrated Water Resources Management (IWRM) is internationally accepted as a toolbox to achieve these objectives. However, implementation of the IWRM-approach is still lacking, especially in developing countries and transitional economies. This study poses the central question of what kind of governance is necessary to achieve an integrated management of water resources. Evaluating the concept from a regional perspective, three case studies have been conducted in Yemen, Jordan and Syria to identify the main governance challenges during the IWRM-process and develop strategies on how to meet them, aiming to improve the practical applicability of the theoretical framework of IWRM in the Middle East.

Water Services Disputes in International Arbitration Reconsidering the Nexus of Investment Protection, Environment, and Human Rights by Xu Qian The argument that universal access to water is a human right is based on the fact that life on Earth cannot exist without water. Yet the enormous cost of building and maintaining water service infrastructure, purifying, monitoring quality, and providing sanitation services is beyond the means of many of the States most in need. Foreign investment is thus mandated—hence the often acrimonious tension manifest in investor-State disputes over water rights. This book offers the first in-depth analysis of both international treaty norms and their interpretation by arbitral tribunals applicable to investment in water and sanitation services, complete with thoroughly researched recommendations for those arbitral practitioners in the eye of the storm. Like no previous study the book clearly reveals how to reconcile the economic and fundamental human interests arising from investment in water and sanitation services under the international investment regime. Among many vital issues, the author highlights the importance of the following: legitimacy of a State ' s alleged regulatory objectives, the suitability of the measures undertaken to achieve the objective, and whether there are less restrictive means available; legal framework and stability of the State; applicable law, changes in law, and emergency circumstances; economic issues such as water pricing; profit-driven private companies ' reluctance to serve the poor; investment tribunals ' generation of a " regulatory and jurisprudential regime " on water and sanitation services; and determination of liability in relation to expropriation, fair and equitable treatment, and necessity. Arguing that the current investment treaty and arbitral case law framework can regulate water and sanitation services if certain interpretations are favored by adjudicators, the author offers viable, sustainable, and reasonable legal solutions. A detailed annex presents cases decided before a variety of arbitral tribunals, as well as relevant WTO and ICJ cases, and reviews critical literature in the field. The increasing number of cases involved with States ' regulatory measures shows that stakes around water services generate specific legal problems which are new in the world of international economic law. As an incisive investigation of what has been called the " incursion of investment tribunal decisions into the regulatory autonomy of host States, " this profound and innovative analysis provides a coherent and consistent method of review that provides greater certainty to both States and investors and deters abuse of power. It will be welcomed by policymakers and stakeholders interested in the implications of " globalization " of water services for the capacity to adapt to climate change and will suggest ways to enable States to better manage vital water services, even after privatization to foreign companies.
